                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cDNA libraries were constructed from a blue pigmented coral, Acropora aspera to isolate sequences encoding polypeptides with N-terminal sequences as shown in AAY97147-48. Pigment protein from coral tissue (PPCT) is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 TACTITICAGGICCAAGGCGAIGGAAAAGGAAAGCCITACGAGGGGGGGGCAGCAGGTAAGG

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for cotaling materials that experience UV damage e.g. place and/or corals, for upholstery. CFMs are useful in the flower industry, in the development of the varieties of flowering plants. Other contemplated uses include,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in structions of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated and green Fluorescent protein (GFP). The sequences given in records ABZ12068-ABZ12195 represent CFM related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120

transgenic animal which exhibits a novel colour e.g. sheep with blue or transgenic animal which exhibits a novel colour e.g. sheep with blue or coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Pluorescent protein (GFP). The sequences given in records ABZ12068-ABZ12195 represent CFM related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   360

The invention relates to an isolated colour-facilitating molecule (CFW) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a cranspanic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing ocloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs embedded in a gel matrix improve image quality in chrowerings or phonographics and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in chrowering colour in elible and/or ornamental chromowhere the distorted light spectra (biomatrix). The first all-protein chromowhere the distorted light spectra (biomatrix). The first all-protein chrowering colour in the colour in the first all-protein chromowhere the distorted light spectra (biomatrix). The first all-protein chromen characterial colour in colour in the situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABZ12068-ABZ12195 represent CFM related DNA

Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous

non-

Claim 6; Page 297-298; 510pp; English

extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for grawing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Pluorescent protein (GFP). The sequences given in records AB212068-AB212195 represent CFM related DNA sequences. (Updated on 07-AUG-2003 to correct OS field.) The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous mon-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece, They are useful for producing coloured plant.

Claim 6; Page 285-286; 510pp; English.

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous convention of particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or ced coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing photortropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or contemplate species, and in fruits and vegetables to enhance their contemplated their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light specira (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABZ12068-ABZ12195 represent CFM related DNA

The invention relates to an isolated colour-facilitating molecule (CFM)

CC comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human ey in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

transgenic animal which exhibits a novel colour e.g. sheep with blue or

cell coloured fleece. They are useful for producing coloured plant

cell coloured fleece. They are useful for producing agent. Other

uses include transducing or intensifying an image, providing additional

light for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

upholstery. CFMs are useful in the flower industry, in the development of

new varieties of flowering plants. Other contemplated uses include,

captression markers, general reporter molecules, photon traps, UV sinks or

in sunscreens. CFMs embedded in a gel matrix improve image quality in

chungal species, and in fruits and vegetables to enhance their

marketability. CFMs embedded in a gel matrix improve image quality in

chromophore to be isolated was Green Fluorescent protein (GFP). The

sequences given in records ABZ12068-ABZ12195 represent CFM related DNA
                                                                                                                                                                                                                                                                                                                                         Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 669;

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous mon-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant

extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABZ12068-ABZ12195 represent CFM related DNA

Prescott M;

The invention relates to an isolated colour-facilitating molecule (CFW)

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

transgent animal which exhibits a novel colour e.g. sheep with blue or

corracts, e.g. flavouring, beverage or juice or colouring agent. Other

cextracts, e.g. flavouring, beverage or juice or colouring agent. Other

uses include transducing or intensifying an image, providing additional

light for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

upholstery. CFMs are useful in the flower industry, in the development of

coating materials that experience to ther contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

come varieties of flowering plants. Other contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

contemplate. CFMs modify visible colour in edible and/or ornamental

contemplated procession flower in fruits and vegetables to enhance their in edible and/or ornamental

contemplatery. CFMs embedded in a gel matrix improve image quality in

contemplate to be isolated was Green Fluorescent procein (GFP). The

contemplate or procession or Sequence 660 BP; 191 A; 147 C; 164 G; 158 T; 0 U; 0 Other; (Updated on 07-AUG-2003 to correct OS field.)

                                                                                                                                                                                                            The invention relates to an isolated colour-facilitating molecule (CFW)

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

rangenic animal which exhibits a novel colour e.g. sheep with blue or

rangenic animal which exhibits a novel colour e.g. sheep with blue or

red coloured fleece. They are useful for producing agent. Other

uses include transducing or intensifying an image, providing additional

light for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

upholstery. CFMs are useful in the flower industry, in the development of

new varieties of flowering plants. Other contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

in sunscreens. CFMs embedded in a gel matrix improve image quality in

fungal species, and in fruits and vegetables to enhance their

marketability. CFMs embedded in a gel matrix improve image quality in

chromophore to be isolated was Green Fluorescent protein (GFP). The

sequences given in records ABZ12068-ABZ12195 represent CFM related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0

The invention relates to an isolated colour-facilitating molecule (CFW)

comprising a polypeptide which, in a cell, alone or together with one or

more obther molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

cransgenic animal which exhibits a novel colour e.g. sheep with blue or

red coloured fleece. They are useful for producing coloured plant

cred coloured fleece. They are useful for producing agent. Other

extracts, e.g. flavouring, beverage or juice or colouring agent. Other

cred coloured fleece. They are useful in the nage, providing additional

light for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

upholstery. CFMs are useful in the flower industry, in the development of

new varieties of flowering plants. Other contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

in sunscreens. CFMs endedity visible colour in edible and/or ornamental

fungal species, and in fruits and vegetables to enhance their

marketablity. CFMs embedded in a gel matrix improve image quality in

situations of distorted light spectra (blomatrix). The first all-protein
                                                                                                                      099
                                                                                                                                                               099
                                                                              900
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               non-

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules impasts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous con-white light or particle emission. CFMs are useful for producing a transgenic anhal which exhibits a novel colour e.g. sheep with blue or cell coloured fleece. They are useful for producing coloured plant or extracts, e.g. flavouring, beverage or juice or colouring agent. Other cuses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or no numerosens. CFMs embedded in a gel matrix improve image quality in the distorted light spectra (biomatrix). The first all-protein contemplated or all-protein contemplated or situations of distorted light spectra (biomatrix). The first all-protein contemplated or all-protein contemplated in contemplated in contemplated in the protein contemplated in the first all-protein contemplated in the protein contemplated in the protein contemplated in the protein contemplated in the protein contemplated in the first and contemplated in the contemplate contemplated in the contemplated in the contemplated in the contemplate contemplated in the contemplated in the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120

extracts, e.g. flavouring, beverage or juice or coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABZ12068-ABZ12195 represent CFM related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                603

Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous white light

-uou

Example 18; Page 485-486; 510pp; English

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleace. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABZ12068-ABZ12195 represent CFM related DNA sednences

                  Patent No. 643662

GENERAL INFORMATION:
APPLICANT: Bryan, Bruce
APPLICANT: PROLUME, LTD.
TITLE OF INVENTION: LOUGEBASES, FLUORESCENT PROTEINS, NUCLEIC ACIDS ENCODING THE LUC
TITLE OF INVENTION: AND FLUORESCENT PROTEINS AND THE USE THEREOF IN DIAGNOSTICS, HIG
TITLE OF INVENTION: SCREENING AND NOVELTY ITEMS
FILE REFERENCE: 27429-112B
CURRENT FILING DATE: 1999-03-6
PRIOR PELLING DATE: 1999-03-6
PRIOR PELLING DATE: 1999-04-6
